

Electromagnetic clutches and brakes

INTORQ 14.105 and INTORQ 14.115

7.5 – 480 Nm

INTORQ

setting the standard

INTORQ – A new name with tradition

INTORQ is a young company that has been spun off from Lenze Bremsen GmbH to take over the production of brakes and clutches. Lenze no longer manufactures these products.

You can now obtain identical products with the same designations and order numbers from INTORQ.

The background of INTORQ demands that it continues to set the international standard for brakes and clutches – after all, our motto is: “Setting the standard”. The INTORQ name also stands for innovation and performance and, as before, for quality, reliability and mature technology.

INTORQ puts the customer first. As an independent company we now want to concentrate more on our customers in the drives sector and pass on our know-how in the development, manufacture and application of brakes and clutches. As far as our international activities are concerned, we shall continue to work closely with the worldwide sales organisation and service teams of Lenze.

Product information

INTORQ electromagnetic clutches and brakes engage torque transmission by friction in dry running conditions. When the DC voltage is applied, torque transmission is achieved free from torsional backlash. The prestressed annular spring on the armature ensures release without residual torque on de-energisation.

The clutches and brakes can be used in any mounting position and are virtually maintenance-free. Depending on the friction energy used, the working air gap only needs to be checked (and if necessary corrected) at specific intervals. Special machining of the friction surfaces ensures that the nominal torques can be achieved even when new, or after very few switching operations without running-in.

The various types of stator and armature designs enable optimum adaptation to the required operating conditions.

The catalogue will help you to select and order the electromagnetic brake and/or electromagnetic clutch you need.

This catalogue contains:

Electromagnetic clutches INTORQ 14.105,
Electromagnetic brakes INTORQ 14.115,
braking torques 7.5 – 480 Nm

Size

06, 08, 10, 12, 16, 20, 25

Stator type

- 1 – Flange-mounting type
- 3 – Type with bearings

Armature type

- 1 – With external flange hub
- 2 – With internal flange hub (for brakes only)
- 3 – Without flange hub
- 5 – With flange hub on bearings (for clutches only)

Variants

- Supply voltage
- Rotor bore
- Armature bore

List of abbreviations

M_K	[Nm]	Rated torque clutch/brake
M_{load}	[Nm]	Load torque
M_a	[Nm]	Acceleration/deceleration torque
M_{req}	[Nm]	Required torque
P	[kW]	Drive power
P_{20°C}	[W]	Coil power clutch/brake at 20°C
n	[rpm]	Speed clutch/brake
J	[kg m ²]	Moment of inertia, reduced to clutch shaft/brake shaft
K		Safety factor (≥ 2)
Q	[J]	Switching energy per switching cycle
Q_E	[J]	Permissible switching energy for single switching cycle, see Technical data
Q_{perm}	[J]	Permissible switching energy dependent on S _h
Q_{NA}	[kWh]	Permissible switching energy until readjustment
S_h	[h ⁻¹]	Operating frequency (number of cycles distributed evenly during unit of time)
S_{hü}	[h ⁻¹]	Transition operating frequency (characteristic to calculate S _h or Q _{perm} , see Technical data)
S_{NA}		Number of switching operations until readjustment
DIN		Deutsches Institut für Normung
VDE		Verband deutscher Elektrotechniker (Association of German Electrotechnical Engineers)

Operating times

The operating times listed in the Technical data are valid for switching on the DC side with the rated air gap and a warm coil. The times are mean values whose accuracy will be determined for example by the type of rectification and the air gap S_{air}.

t₁	[s]	engagement time, $t_1 = t_{11} + t_{12}$
t₂	[s]	Disengagement time (time from the beginning of the torque reduction until 0.1 M _K) is reached. Approximately 6 times longer for AC switching than for DC switching.
t₃	[s]	Slipping time (time during which a relative motion occurs between the input and output, with clutch/brake engaged)
t₁₁	[s]	Response delay time (time between the voltage being connected and the torque starting to rise)
t₁₂	[s]	Rise time (time from the beginning of the torque rise until 0.9 M _K is reached)

Product information

Electromagnetic clutches and brakes are used wherever rapid acceleration or deceleration of moving masses is required.

This document describes powerful and reliable mass-produced products which have already been tried and tested in numerous applications.

A complete range

- 7 sizes
- Clutch/braking torques from 7.5 – 480 Nm

Versatile

- Suitable for any mounting position
- Clutches can be supplied in flange-mounted or shaft-mounted versions
- Various types of armature design for clutches and brakes can be supplied for adaptation to any application

Torque transmission

- Friction transmission in dry running
- Ready for operation immediately
- Special machining of the friction surfaces ensures that the rated torques are achieved after very few switching operations without a run-in procedure

Reliable

- The certified ISO 9001 and ISO 14001 quality system provides the basis for consistently high-quality products
- Manufacture and testing to VDE 0580

Low maintenance

- Air gap simply has to be checked depending on the friction energy used
- Wear adjustment only required at 2.5 times rated air gap
- Low-wear asbestos-free friction linings and nitride hardened armature plates ensure long service life and constant torques

Release without detent torque

- The prestressed annular spring on the armature element ensures release without residual torque on de-energisation

Short and consistent operating times

- The prestressed backlash-free annular spring on the armature enables short and constant operating times to be achieved even with larger working air gaps

Options

- Voltages and bores different from the standard design can be supplied on request

Product information

Principle of operation

To generate the torque or braking torque, the stator coil is supplied with DC voltage and a magnetic field is generated. The magnetic attraction force pulls the armature plate on the armature assembly against the force of the prestressed spring across the air gap and towards the friction surface of the brake armature or rotor, thereby making torque available.

If the voltage supply is interrupted, the magnetic field will collapse and the prestressed annular spring will pull the armature plate back to its initial position.

Flange-mounted brakes

INTORQ 14.115.□□.1.□

Flange-mounted clutches

INTORQ 14.105.□□.1.□

Shaft-mounted clutches

INTORQ 14.105.□□.3.□

Flange-mounted clutches and brakes

The stator and flange should be mounted centrally on the shaft. Two tolerated diameters are available for this purpose.

The clutch rotor is mounted on the shaft using a keyway connection and secured against axial movement. Mounting dimension “b” under “Dimensions” must be observed exactly.

Shaft-mounted clutches

If a suitable mounting surface for the flange stator is not available, a shaft-mounted clutch should be used. The stator is supported on the rotor. A pin, which engages in the anti-rotation tag with sufficient clearance, simply has to take up the bearing friction.

Torque is transmitted via a keyway connection as on flange-mounted clutches.

Armature elements

Type 1; 2 and 5 armature elements should be mounted on the shaft and secured against axial movement following precise setting of the working air gap s_{air} (see Dimensions). Armature element type 3 should be screwed to the element to be decelerated or accelerated (e.g. belt pulley) via the annular spring. See page 24 for the screws and lock washers to be used. Please make sure that the clearance holes for the rivet heads on the armature element are large enough not to restrict the axial movement of the armature plate.

Selection

Dimensioning

Determining the size by specifying the required torque M_{req}

Parameters included in the calculation are moments of inertia, relative speeds and acceleration or deceleration times.

K is a safety factor to ensure transmission security even in extreme operating conditions.

K is dependent on the prevailing operating conditions. K is always ≥ 2

Checking the thermal load

The switching energy per switching cycle Q and the operating frequency S_h determine the thermal load of the clutch or brake. The values calculated or plotted on a graph must not exceed the permissible values for the specific sizes.

Parameters Q_E and $S_{h\ddot{u}}$ are indicated in the Technical data (page 13).

Q_{perm} and S_{hperm} can also be taken from the diagram on page 11 for sizes 06 to 25.

Operating data calculation

Q_{NA} is indicated in the Technical data (page 13).

Selection

Permissible switching energy/operating frequency

Electromagnetic clutches

INTORQ 14.105 (7.5 – 480 Nm)

Electromagnetic brakes

INTORQ 14.115 (7.5 – 480 Nm)

Calculation example

Default parameters:

$$J = 0.01 \text{ kgm}^2$$

$$M_{\text{load}} = 6 \text{ Nm}$$

$$n = 700 \text{ rpm}$$

$$t_3 = 0.15 \text{ s}$$

$$\frac{t_{12}}{2} \text{ assume } 0.03 \text{ s}$$

$$S_h = 5000 \text{ switching operations per hour}$$

Calculation of the required torque:

$$M_a = \frac{J \cdot n}{9.55 \cdot \left(t_3 - \frac{t_{12}}{2}\right)} = \frac{0.01 \cdot 700}{9.55 \cdot (0.15 - 0.03)}$$

$$M_a = 6.1 \text{ Nm}$$

$$M_{\text{req}} = (M_a + M_{\text{load}}) \cdot K = (6.1 + 6) \cdot 2$$

$$M_{\text{req}} = 24.2 \text{ Nm}$$

Electromagnetic clutch selected:

INTORQ 14.105.10.1.1 with

$$M_K = 30 \text{ Nm}$$

Calculation of the switching energy per switching cycle:

$$Q = \frac{J \cdot n^2}{182.5} \cdot \frac{M_K}{M_K - M_{\text{load}}}$$

$$Q = \frac{0.01 \cdot 700^2}{182.5} \cdot \frac{30}{30 - 6}$$

$$Q = 33.6 \text{ J}$$

Check of the permissible operating frequency:

See the diagram (above) for $S_{h\text{perm}}$ depending on the calculated switching energy.

For the selected size (10), the required operating frequency is permissible at the calculated switching energy.

Result:

The selected electromagnetic clutch (INTORQ 14.105.10.1.1. $M_K = 30 \text{ Nm}$) can be used for this application.

Accessories

Transformer switch TS 48 INTORQ 14.610.11.048

Features

- Transformer switch TS 48 contains the entire power supply for a 24 V DC coil with transformer, rectifier and switching transistor with suppressor circuit
- A transistor is used for switching; there is no contact wear
- The high induced voltage enables the release times indicated in the catalogue for switching on the DC side to be achieved

Dimensions

Connection examples

Control via PLC

Applications

- Power supply for 24 V coils on AC mains
- Normal excitation with coil rated voltage
- Switching of coil current via PLC, proximity switch, contacts, control voltage 5 – 24 V

Technical data

Normal excitation	24 V
Mains voltage	230 V, 50/60 Hz
Coil voltage	24 V =
Max. coil load	50 W

Max. operating frequency:

Up to 35 W	5 switching operations/s
Up to 50 W	2 switching operations/s

Connectable coils	1 x
Switching of coil current:	Transistor
The entire switching operation is potential-free.	
Control current at 24 V	approx. 1 mA
Weight:	1.5 kg

Control via contact

Control via 2-wire proximity switch

Accessories

Spark suppressor INTORQ 14.198.00.01/02/03

Features

The INTORQ spark suppressor protects the coil and contact against impermissibly high induced voltages with switching on the DC side. In the absence of a suppressor circuit, the induced voltage may exceed the permissible values specified in VDE 0580 and cause coils to fail.

The spark suppressor comprises an induction-free pulse capacitor which takes up the high-speed current peaks which occur during switching. This significantly reduces the spark at the contact (contact wear).

Application

Suppressor circuit for coil and contact:

- Limitation of coil induced voltage
- Spark suppression at switching contacts
- Increase in service life of coils and contacts

Dimensions

Accessories

SEGC high-speed switch INTORQ 14.611

Features

INTORQ-SEGC high-speed circuit-breakers are used for the high-speed excitation of DC voltage coils and reduce engagement times to as little as 10% of the values indicated in the Technical data.

Switching is wear-free via semiconductors. This makes simple activation with auxiliary contacts, control voltages or proximity switches possible. Following overexcitation, the coil operating voltage is automatically reduced to the holding voltage.

For more detailed technical information, see the “Electronic switchgear” manual.

Application

High-speed excitation of DC voltage coils with a rated voltage of 24 to 205 V.

You can use INTORQ-SEGC high-speed switches on electromagnetic clutches/electromagnetic brakes to achieve:

- Shorter acceleration/deceleration times
- Higher operating frequencies
- Improved switching accuracy
- Reduced wear
- Improved stopping accuracy

SEGC-Electronic INTORQ 14.611.12.□□□

- Structure: PCB 220 x 150 mm
- Connection via 10-pin terminal strip
- Max. connected load 100 W
- Required accessories: MP capacitor

SEGC-Europe INTORQ 14.611.14(16).□□□

- Design is identical to that of the SEGC-Electronic in terms of electronics
- Built with European standard board dimensions 160 x 100 mm
- Connection via 31-pin DIN plug connector
- Max. connected load 40 W or 100 W
- Required accessories: MP capacitor, plug-in rack

General information for assembly

- Assembly and maintenance work may only be carried out by specialist personnel with appropriate training and only in accordance with the specifications in Lenze's Operating and Mounting Instructions.
- Grease or oil on friction surfaces reduces drive and braking torque. It is for this reason that friction surfaces must be kept free from grease and oil.
- The regulations set out in the machine safety law for rotating drive elements must be observed.
- If units with large diameters are switched in at high speeds, the high relative speed at the friction surfaces can generate sparking. The use of a suitable cover is recommended.
- The air gap S_{air} must be checked at regular intervals and readjusted no later than $2.5 \times S_{air}$ (see Technical data).

Installation examples

Electromagnetic clutch INTORQ 14.105.□□.3.5

with a V-belt pulley on the armature.

The air gap is set using disc springs between the ball bearing and rotor. A pin in the lug on the stator prevents the stator being turned by means of the friction in the ball bearing.

Electromagnetic brake INTORQ 14.115.□□.1.3

with pulley for belt.

The stator is mounted centrally on the shaft using a ball bearing. The air gap is set using a spacer ring and shims between the ball bearing and pulley.

Electromagnetic clutch INTORQ 14.105.□□.1.1

to connect two aligned shafts.

Centring to shaft by means of tolerated outer diameter of stator. The rotor is mounted on the driven shaft using a keyway connection and secured against axial movement. A keyway connection is also used to mount and secure the armature element against axial movement on the shaft to be linked. Shims should be used to set the air gap.

INTORQ – Sales and Service around the world

Our customers can reach us at any time from anywhere in the world. We work with Lenze's network of worldwide sales offices and Service Centers.

Our helpline (008000 24 46877) will provide you with expert advice, 24 hours a day, 365 days a year.

Information about our products, catalogues and Operating Instructions can be found at **www.intorq.com**.

Contact Lenze Service Centres and sales partners via the Lenze website at **www.Lenze.com**.
